Definition of Research Data:
the recorded information (regardless of the form or the media in which it may exist) necessary to support or validate a research project’s observations, findings or outputs, or which is required for legal or regulatory compliance.

http://researchdata.ox.ac.uk/university-of-oxford-policy-on-the-management-of-data-supporting-research-outputs/
Research data and records should be:

**a.** stored *securely* and *preserved* in order to ensure its continuing utility;

**b.** appropriately *identifiable*, *retrievable*, and *available* when needed;

**c.** an accurate, complete, reliable and coherent representation of the materials collected;

**d.** kept in a manner that is compliant with *legal obligations*, including the Data Protection Act 1998 / The General Data Protection Regulation (GDPR) (Regulation (EU) 2016/679) and the Freedom of Information Act 2000, and, where applicable, the requirements of funding bodies and project-specific protocols approved under the University Policy on the Ethical Conduct of Research Involving Human Participants and Personal Data;

**e.** able to be *made available to others* in line with appropriate ethical, data sharing and open access principles, especially when the data underpins published research.

The HFS backup service is available to Oxford University staff, senior members and postgraduates running Windows, Mac OS X, Linux and Unix. Recent changes now allow users working away from Oxford to backup over VPN to the standard desktop backup service.
Founded in 2010, ORCID (Open Researcher & Contributor ID) is an open, non-profit, community-based effort to provide a registry of unique researcher identifiers, ORCID iDs, and a method of linking research-related items, such as articles as datasets, to these identifiers. An increasing number of publishers and research funders are using ORCID iDs as a way for researchers to identify themselves when submitting publications or bids.

Finding Specialist Resources

Introduction

Visual anthropology can be broadly understood as the anthropological study of the visual and the visual study of the anthropological. However, for much of its history, the term has been associated almost exclusively with ethnographic film (see Ethnographic Film) and it is only recently that a broader consideration of other visual forms and visuality itself have come under the subdiscipline’s purview. In the last decade, the boundaries have expanded further, partly through changes in technology (expensive celluloid film technology giving way to cheap high-quality video and digital processes, the rise of the Internet) but more through changes in theory and the opening up of new lines of intellectual inquiry. As with many other subdisciplines within the field of anthropology, many visual anthropologists would claim that they are simply anthropologists—with the same interests in kinship, politics, the economy, aesthetics, materiality, religion, and so forth as their colleagues—but with a special attention paid to the visual and visible manifestations of those areas of human activity and creativity. The subdiscipline overlaps strongly with the anthropology of art and with the anthropology of material culture as well as with other disciplines such as media studies, film studies, and photographic history; in recent years, the field has also overlapped with action anthropology and other applied work coming out of development studies, and the rise of the Internet has given a new forum for the storage, study, and dissemination of images. There is no equivalent subdiscipline in the fields of archaeology and biological anthropology and primatology, though scholars in these fields do of course use photography and film or video for purposes of documentation (archaeology, forensic anthropology) and recording observations (primatology); interpretative approaches in archaeology, for example in the study of rock art, may draw upon approaches from visual anthropology as well as from the anthropology of art and the anthropology of material culture.

Data and statistics

Finding Data

To assist researchers and students identify statistics and data most relevant to their research, the Bodleian Data Library highlights key resources according to theme and region, with additional information about data providers and types. Data is defined here in its broadest sense to refer to research information that is collected and then used to inform analysis. This includes audio-visual, textual and – in most cases - statistical data resources.

When considering data it can be useful to think about not only different sources, but also the ways in which data is gathered and provided and the implications this has on the research process. Students new to using data may find these pages of the Bodleian Data Library particularly helpful.

There is overlap with the data resources that may be found using OxLib+ (Oxford Libraries Information Platform) or SOLO (Search Oxford Libraries Online) and LibGuides. The Bodleian Data Library does not aim to duplicate these resource discovery tools which should also be consulted in the course of research.

Geopolitics and visuality: Sighting the Darfur conflict

By: Campbell, D (Campbell, David)

POLITICAL GEOGRAPHY

Conference
Conference: 102nd Annual Meeting of the Association-of-American-Geographers
Location: Chicago, IL,
Date: MAR 01, 2006
Sponsor(s): Assoc Amer Geographers

Abstract
In the many considerations of visual culture in geography, there are few works concerned with the visual culture of contemporary geopolitics. In seeking to rectify this lacuna, this paper outlines elements of a research project to consider the way visuality is a pivotal assemblage in the production of contemporary geopolitics. Signalling the need for a conceptual exploration of the importance of vision and visuality to all forms of knowledge (rather than just those associated with or manifested in specific visual artefacts like pictures), the paper argues that understanding the significance of visuality for geopolitics involves rethinking visual culture as visual economy. This enables the constitutive relations of geopolitics and visuality to shift from the social construction of the visual field to the visual performance of the social field. This argument is illustrated through an examination of some of the documentary photography and photo-journalism covering the most recent outbreak of war in Darfur, Sudan, beginning in the summer of 2003. Exploring the tension in these pictures between the established disaster iconography of 'Africa' and the desire to image genocidal violence and war crimes, considering in particular the way photography captures identity, the argument concludes with reflections on the way the visual performance of the social field that is Darfur structures our encounters with others. ©2006 Elsevier Ltd.
